W-PS-1 · AI Group Project Coordinator

Keep a college group project moving. Agentic AI · real messaging integration · live demonstration · 24 hours.

The story

A college project is due tomorrow. Aanya has finished the slides, Kabir is waiting for the API, and Meera thinks the integration is already done. Their group chat has hundreds of messages. The task list has not changed in three days.

Someone needs to ask the right people for updates, understand what is blocking them, and keep the project status accurate. That person is usually a student who would rather be building.

Build the agent that takes on the follow-up.

Problem overview

Build an AI agent that coordinates a group project through a real messaging platform. It should follow up on pending tasks, interpret replies from participants, identify blockers, and update task progress.

The challenge

- Start from a project task list with owners and current statuses.
- Contact real participants through Telegram, Slack, or another real messaging integration.
- Understand their replies and distinguish progress, completion, and blockers.
- Update the task record and make the latest project status visible.
- Demonstrate the loop: task → follow-up → participant response → status update.

Room to grow

Build the core loop within 24 hours. Extend it in directions such as these, or propose your own. These are optional extensions, not a feature checklist.

- **Deliverables and reports:** track milestones, dependencies, and handoffs; generate progress reports and highlight risks.
- **Automations:** run scheduled check-ins, deadline reminders, recurring updates, and blocker escalations.
- **Slot coordination:** find meeting, work, or presentation slots from participant availability and handle changes.

Example

Illustrative demo scenario; teams may use their own project and task format.

Step	What happens
Starting task	Kabir owns “Connect the payment API.” Its status is Pending.
Agent action	The agent messages Kabir to ask for an update.
Participant reply	“The API is connected, but I am waiting for test credentials.”
Expected update	The task is marked Blocked, with “test credentials” recorded as the blocker. It is not marked Complete.
Follow-through	After Kabir receives credentials, completes testing, and replies, the agent updates the task to Complete.

Data and tools

- **Project data:** simulated tasks, owners, deadlines, and statuses are allowed. Create a small project your demo participants can act out.
- **Messaging:** use a real Telegram, Slack, or similar integration and real participants.
- **Implementation:** choose your own language, frameworks, storage, and LLM provider.

Recommended: OpenCode free models
OpenCode provides free models. We recommend using them during the hackathon. Check current availability in the OpenCode free-model documentation.

Rules

- A live, working demo is mandatory. Simulated project data is allowed; messages and participant replies must pass through the real integration.
- The agent must interpret replies and update task statuses. A sequence of canned messages alone does not complete the challenge.
- Teams are free to choose their coordination approach. Keep the scope achievable in 24 hours.

Deliverables and judging

Prepare the following for the final demonstration:

- **Working prototype:** demonstrate the complete workflow with the required real integrations.
- **Code and README:** explain how to run the project, configure integrations, and reproduce the demo.
- **Demo evidence:** show the starting task list, real messages and replies, identified blockers, and the resulting task-status changes.
- **Live presentation:** suggested format is a 5-minute demo followed by 3 minutes of Q&A.

Each criterion is scored **1-5**, for a maximum of **15 points**.

Criterion	What judges evaluate	Score
Functional Completeness	Does it do what it is supposed to do?	1-5
Quality of Execution	How well does it work? Consider accuracy, reliability, and unexpected scenarios.	1-5
Thought, Effort & Creativity	How much thought, effort, and originality went into the solution?	1-5

Judges may introduce unexpected scenarios. Optional extensions are welcome; depth and quality matter more than feature count.

Mentorship and supervision

Worcflow team members will be present for a couple of hours on Friday and a couple of hours on Saturday for supervision, mentorship, and technical Q&A. Exact slots will be coordinated with the organizers; support outside these hours is subject to team availability.

Open WhatsApp group

Anyone can join and ask questions about the challenge or technical blockers.

Join the Worcflow hackathon group

Winners and prizes: handled by the hackathon organizers. Worcflow judging representatives will be confirmed separately.

W-PS-2 · AI Career Coach

Show what your portfolio proves, and what it does not. Agentic AI · GitHub + real job requirements · live demonstration · 24 hours.

The story

Rohan wants a backend internship. The job posting asks for APIs, SQL, testing, and deployment. His resume lists all four. His GitHub has six repositories, but which of those skills do they actually demonstrate?

He adds database queries and tests to a project over the weekend. A one-time resume review will not notice. His assessment should change when his work changes.

Build an agent that keeps the skill-gap assessment current.

Problem overview

Build an AI agent that compares a student's demonstrated GitHub skills with real job or internship requirements. It should identify evidence-backed gaps and reassess relevant skills when the repositories change.

The challenge

- Discover real job or internship requirements.
- Analyze the student's actual GitHub repositories for demonstrated skills.
- Compare portfolio evidence with the requirements and explain the gaps.
- Detect repository changes and automatically reassess the affected skills.
- Demonstrate the loop: job requirements → repository evidence → gaps → code change → updated assessment.

Room to grow

Build the core loop within 24 hours. Extend it in directions such as these, or propose your own. These are optional extensions, not a feature checklist.

- **Resume discovery:** scan portfolio changes for new projects, achievements, skills, or contributions worth adding; draft evidence-backed resume updates.
- **Career research:** research relevant technologies, domains, roles, and companies to identify valuable skills and experience to build.
- **Next steps:** suggest learning or project opportunities and track progress. Separate future recommendations from achievements already demonstrated.

Example

Illustrative assessment; use a real job posting and repository in your demo.

Requirement	Before the change	After the change
API development	Routes and request handlers are present: demonstrated.	Unchanged: evidence remains in the same files.
SQL	No database-query evidence found in the analyzed code.	A commit adds SQL queries: cite the changed files and reassess.
Automated tests	No test evidence found in the analyzed scope.	Tests are added: update the assessment and cite the test files.

The update should follow a detected repository change, without manually rewriting the assessment. A missing signal in the repository means “not demonstrated in this scope,” rather than proof that the student lacks the skill.

Data and tools

- **Job requirements:** use real, publicly available job or internship postings and retain their source links.
- **Portfolio evidence:** use real GitHub repositories and identify the files or code supporting each assessment.
- **Change detection:** choose a practical mechanism, such as polling or GitHub webhooks. You may use a repository you control to demonstrate an actual commit.

Recommended: OpenCode free models
OpenCode provides free models. We recommend using them during the hackathon. Check current availability in the OpenCode free-model documentation.

Rules

- Use real job requirements and real GitHub integrations. A static, manually refreshed report does not complete the change-detection requirement.
- Make claims traceable to repository evidence and keep uncertainty clear.
- Choose your own language, frameworks, and LLM provider. Resume updates, career research, learning plans, and project recommendations are optional extensions.

Deliverables and judging

Prepare the following for the final demonstration:

- **Working prototype:** demonstrate the complete workflow with the required real integrations.
- **Code and README:** explain how to run the project, configure integrations, and reproduce the demo.
- **Demo evidence:** show the job source, repository evidence, initial gaps, a real repository change, and the automatically revised assessment.
- **Live presentation:** suggested format is a 5-minute demo followed by 3 minutes of Q&A.

Each criterion is scored **1-5**, for a maximum of **15 points**.

Criterion	What judges evaluate	Score
Functional Completeness	Does it do what it is supposed to do?	1-5
Quality of Execution	How well does it work? Consider accuracy, reliability, and unexpected scenarios.	1-5
Thought, Effort & Creativity	How much thought, effort, and originality went into the solution?	1-5

Judges may introduce unexpected scenarios. Optional extensions are welcome; depth and quality matter more than feature count.
